"*" Denotes less than 3.

Area 4 county Stats are current thru: 12/2/2008

For National Figures go to: www.cdc.gov/hiv/stats.htm

Area 4 Department of Corrections cases have been excluded.

Florida Stats are current thru: 9/30/2008

Florida Law (s.384.25, F.S.) requires cases of AIDS to be reported by anyone who diagnoses or treats a person with AIDS.

A person who tests positive for Human Immunodeficiency Virus (HIV) on or after July 1, 1997 is also reportable.

Note: There is a \$500 fine per case for failure to report.

Confidentiality is strictly enforced & guaranteed. Please comply with all information security and mailing protocols.

Submit your HIV/AIDS case reports(s) in an envelope marked "CONFIDENTIAL" to any of the following personnel:

HIV and Other Health Problems

People living with HIV often have other health problems. These problems might be:

- Infections that happen only when a person has a weak immune system (the system that protects it from germs and infections). Remember, HIV destroys the immune system
- Infections that can happen to all people but are worse in people who are HIV+. Examples of this kind of infection are hepatitis or herpes, even common health problems, such as heart disease or diabetes

Printed below are other kinds of health problems that can affect people with HIV in various areas of the body.

Depression and other nervous system diseases

If you have HIV, some diseases can affect your brain and your nervous system:

- [Depression](#)
- [Toxoplasmosis](#)
- [Cryptococcal meningitis](#)
- [Peripheral neuropathy](#)

HIV and GI system problems

The gastrointestinal system (GI or digestive system) is the group of organs in the body that digests food and picks up (absorbs) the nutrients your body needs. The GI system is made up of the mouth, esophagus (the tube leading from the mouth to the stomach), stomach, pancreas, liver, gallbladder, small intestine, and large intestine.

Some GI problems are common in people with HIV. These include:

- [Diarrhea](#)
- [Gastroesophageal reflux disease \(GERD\)](#)
- [Oral thrush](#)

Diabetes and other metabolic disorders

Your metabolism (said: muh-TAB-ul-ism) is the process your body uses to get energy or make energy from the food you eat. Sometimes changes in your body stop this process from working the right way. Two things might happen. You might end up with too much of some things in your body. Or you might end up with too little of others. Either way, your health suffers.

You can get a metabolism problem (metabolic disorder) if an organ in your body (such as your liver or pancreas) is diseased or does not work well. These disorders can also be caused by HIV infection and HIV medicines. Some of these disorders are:

- [Diabetes](#)
- [Wasting syndrome](#)
- [Lipodystrophy](#)

Liver disease

The liver cleans waste from your body. It changes sugars into energy for your body to use. It also produces bile, a digestive juice.

One kind of liver disease is hepatitis (said: heh-puh-TY-tis). There are 3 main types of hepatitis: hepatitis A, hepatitis B, and hepatitis C. All 3 are caused by viruses. Cirrhosis (said: suh-ROW-sis) is another liver disease. Click on the links below to learn more about these liver diseases.

- [Hepatitis A](#)
- [Hepatitis B](#)
- [Hepatitis C](#)
- [Cirrhosis](#)

Pneumonia and other respiratory diseases

HIV can cause problems with your respiratory system. This system includes your mouth, nose, windpipe, and lungs. These problems can cause infections and make it hard for you to breathe.

- [Pneumonia](#)
- [Tuberculosis](#)

Keep in mind, nothing printed on this page should take the place of talking with your healthcare provider. And also remember, if you have any questions concerning your HIV status, GET TESTED.
